

Title: HYGIENE AND SANITATION IN FIELD AND CAMP

National Cadet Corps (NCC) â Official Directorate General Training Notes

1. DOCTRINE OF FIELD SANITATION: Camp sanitation is the foundation of preventive military medicine. Disease non-battle injuries (DNBI) have historically incapacitated more soldiers than direct enemy action. Strict enforcement of sanitation discipline prevents epidemic outbreaks in temporary tented encampments and Combined Annual Training Camps (CATC).

2. SITING & PERIMETER REGULATIONS: Key camp layout regulations dictate that field latrines and garbage disposal points must be located strictly downwind from cadet living areas and at a minimum distance of 100 meters away from natural drinking water sources and cookhouses/mess tents.

3. FIELD LATRINE SPECIFICATIONS: For short-duration camps up to 3 days, Shallow Trench Latrines (STL) are constructed measuring 3 feet long, 1 foot wide, and 1.5 feet deep, covered with dry loose earth after each use. For permanent camps lasting 10 to 14 days, Deep Trench Latrines (DTL) measuring 6 to 8 feet deep with fly-proof wooden squatter boxes are mandatory.

4. WASTE DISPOSAL & VECTOR CONTROL: Organic waste must be incinerated daily or buried in deep covered soakage pits. Regular spraying of lime powder and permitted larvicides around wet areas prevents fly and mosquito breeding.
