

Title: FIRST AID IN CAMP EMERGENCIES AND TRAUMA

National Cadet Corps (NCC) â Official Directorate General Training Notes

1. DEFINITION & OBJECTIVES OF FIRST AID: First Aid is the immediate, life-preserving medical intervention rendered to an injured casualty before professional medical personnel arrive or before evacuation to an Advanced Dressing Station (ADS).

2. THE PRIMARY SURVEY (GOLDEN ABC SEQUENCE): Priority A (Airway): Check and clear mouth obstructions, vomit, or tongue blockage. Priority B (Breathing): Assess chest rise and air movement; perform mouth-to-mouth resuscitation if absent. Priority C (Circulation): Check radial or carotid pulse; control severe hemorrhage immediately using direct wound pressure and pressure dressings.

3. FRACTURE STABILIZATION & IMMOBILIZATION: Suspected bone fractures must be immobilized using rigid splints, triangular bandages, or improvised rifles/canes before casualty movement. Never attempt to push exposed bone fragments back into the skin.

4. HEAT ILLNESS & DEHYDRATION MANAGEMENT: For heat exhaustion and heat stroke casualties, immediately move the cadet to cool shaded ventilation, loosen restrictive uniforms and boots, apply ice/cold wet compresses to neck, armpits, and groin, and administer oral rehydration salts (ORS) if conscious.
