

Title: FORWARD AND BACK BEARINGS AND COMPASS CONVERSIONS

National Cadet Corps (NCC) â Official Directorate General Training Notes

1. FORWARD BEARING (FB): The direct bearing measured from the observer's position towards an observed target object or navigational waypoint.

2. BACK BEARING (BB): The reciprocal bearing looking back from the target object toward the observer. Crucial for confirming navigation lines and executing re-section.

3. THE GOLDEN BACK BEARING MATHEMATICAL RULE: If the Forward Bearing is less than 180° , add 180° : $BB = FB + 180^\circ$. (Example: If FB is 045° , then $BB = 045^\circ + 180^\circ = 225^\circ$). If the Forward Bearing is greater than 180° , subtract 180° : $BB = FB - 180^\circ$. (Example: If FB is 270° , then $BB = 270^\circ - 180^\circ = 090^\circ$).

4. INDIVIDUAL ERROR & PRISM CORRECTION: Before measuring bearings, cadets must check compass individual error against a surveyed base line and adjust observed magnetic bearings to grid bearings.
