

Title: SETTING A MAP AND DAY & NIGHT NAVIGATION

National Cadet Corps (NCC) â Official Directorate General Training Notes

1. SETTING (ORIENTING) A MAP: A map is set when its top north corresponds with the actual North on the ground. A map can be set by Compass (aligning magnetic line with needle) or by Ground Features (matching linear features such as roads or railway lines).

2. DAY NAVIGATION & PACE COUNTING: Movement in daylight utilizes pace counting as a dead-reckoning distance measure. For an average cadet, 120 natural double paces equals approximately 100 meters on flat terrain. In hilly or swampy ground, pace count increases by 10% to 20%.

3. NIGHT MARCH CHARTS & LUMINOUS MARKS: Night navigation is conducted without visible ground landmarks. Troops prepare a Night March Chart detailing sequential legs, grid bearings, distances in paces, and identifiable luminous waypoint objects.

4. STEERING BY STARS: In the Northern Hemisphere, the Pole Star (Polaris) identified using the Great Bear (Ursa Major) constellation provides a dependable reference for True North.
